Smokeping & Cacti

intERLab at AIT Workshop March 11-15 – Bangkok, Thailand Hervey Allen

nsrc@intERLab

What's the Difference?

There's definite overlap, but:

 Smokeping: A latency measurement and packet loss tool. Uses RRDtool to maintain it's data store. No remote daemons or services required:

"SmokePing is a deluxe latency measurement tool. It can measure, store and display latency, latency distribution and packet loss. SmokePing uses RRDtool to maintain a longterm data-store and to draw pretty graphs, giving up to the minute information on the state of each network connection."

> nsrc@intERLab Bangkok, Thailand

What's the Difference?

 Cacti: Uses RRDtool, PHP and stores data in MySQL as well as supporting SNMP and graphing with MRTG.

"Cacti is a complete frontend to RRDTool, it stores all of the necessary information to create graphs and populate them with data in a MySQL database. The frontend is completely PHP driven. Along with being able to maintain Graphs, Data Sources, and Round Robin Archives in a database, cacti handles the data gathering. There is also SNMP support for those used to creating traffic graphs with MRTG."

nsrc@intERLab Bangkok, Thailand

Installation

We'll install both products:

- Installation varies between flavors of Linux and UNIX.
- It's pretty easy to to install these items under Ubuntu.
- You can do massive configuration of each. We'll do some to get you started!

nsrc@intERLab Bangkok, Thailan

Smokeping: Some Details

Basic install is extremely easy:

```
apt-get install smokeping
```

 Basic config file (/etc/smokeping/config) is simple, but you can get very complex very quickly:

http://oss.oetiker.ch/smokeping/doc/smokeping_examples.en.html and, other configuration options:

http://oss.oetiker.ch/smokeping/doc/smokeping_config.en.html

nsrc@intERLab

Smokeping: Some Details

/etc/smokeing/config

- Check on latency of connection (ping)
- Check on web server uptime and performance

Latency

```
++ LocalMachine
menu = The NOC
title = The noc@intERLab
host = localhost
```

Smokeping: The Install

- 1. sudo apt-get install smokeping
- 2. sudo apt-get install echoping
- 3. su (to become root)
- 4. cd /etc/smokeping
- 5. mv config config.orig

Then we will grab a copy of our local Smokeping config file, install this and go over it.

- $6. \ \text{scp inst@noc:/etc/smokeping/config /etc/smokeping/config}$
- 7. /etc/init.d/smokeping restart

nsrc@intERLab Bangkok, Thailand

Smokeping: More Details

/etc/smokeing/config

• Performance/Uptime

```
++ NOCsquid
menu = The NOC Squid
title = www-cache / HTTP for noc@intERLab
probe = EchoPingHttp
host = localhost
port = 8080
url = http://localhost/
```

nsrc@intERLab Bangkok, Thailar nsrc@intERLab Bangkok, Thailand

Smokeping: The Install

There are several more examples here:

http://oss.oetiker.ch/smokeping/doc/smokeping_examples.en.html

If there is time we will play with /etc/smokeping/config to customize as you want and, maybe, to use some of the example described in the file linked above.

nsrc@intERLab

Smokeping: The Install

Once configured, then restart the service to build the directories with RRD data:

/etc/init.d/smokeping restart

You can find your graphs and layout at:

http://hostname/cgi-bin/smokeping.cgi

Lets have a look at the config file...

nsrc@intERLab Bangkok, Thailar

cacti

cacti: The Install

Installation is a bit tricky... (as root):

apt-get install mysql-server-5.0

mysqladmin --user=root -password=instPass create cacti

apt-get install cacti

login with admin/admin then change

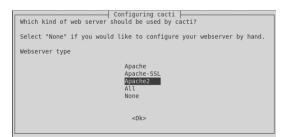

nsrc@intERLab Bangkok, Thailand nsrc@intERLab Bangkok, Thailand

apt-get install mysql-server-5.0

Enter the same password we have used during the workshop for the *inst* account.

nsrc@intERLab

apt-get install cacti

Please choose "Apache2" and then Ok.

nsrc@intERLab Bangkok, Thailand

apt-get install cacti

── Configuring libphp-adodb ├─

WARNING: include path for php has changed!

libphp-adodb is no longer installed in /usr/share/adodb. New installation path is now /usr/share/php/adodb.

Please update your php.ini file. Maybe you must also change your web-server configurator.

You can ignore this

nsrc@intERLab

apt-get install cacti

Configuring cacti

cacti must have a database installed and configured before it can be used. If you like, this can be handled with dbconfig-common.

If you are an advanced database administrator and know that you want to perform this configuration manually, or if your database has already been installed and configured, you should refuse this option. Details on what needs to be done should most likely be provided in /usr/share/doc/cati.

Otherwise, you should probably choose this option.

Configure database for cacti with dbconfig-common?

<Yes>

No>

Choose "Yes" at this screen.

nsrc@intERLab

apt-get install cacti

| Configuring cacti | What is the password for the administrative account with which this package should create its MySQL database and user?

Password of your database's administrative user:

| Concel>

Enter the same password you used when installing MySQL previously. This is your *inst* account password.

nsrc@intERLab Bangkok, Thailand

cacti: Next Steps

Next open a web browser on your machine and go to the address:

http://localhost/cacti

You will see the following screens...

Please provide a password for cacti to register with the database server. If left blank, a random password will be generated for you.

MySQL application password for cacti:

Therefore

Therefore

Configuring cacti

Therefore

Configuring cacti

Password confirmation:

apt-get install cacti

apt-get install cacti

Thanks for taking the time to download and install cactl, the complete graphing solution for your network. Before you can start making cool graphs, there are a few pieces of data that cactl needs to know. Make sure you have read and followed the required steps needed to install cactl before continuing. Install information can be found for <u>Unix</u> and <u>Win32</u>-based operating systems. Also, if this is an upgrade, be sure to reading the <u>Upgrade</u> information file. Cactl is licensed under the GNU General Public License, you must agree to its provisions before continuing: This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version. This program is distributed in the hope that it will be useful, but WITHOUT AIY WARRANTY; without even the implied warranty of MERCHANTRILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

Click on "Next >>"

nsrc@intERLab

apt-get install cacti

Be sure "New Install is chosen and press the "Next >>" button.

nsrc@intERLab

apt-get install cacti

Hopefully your screen looks like this. If not, let your instructor know.

Press "Finish"

nsrc@intERLab

cacti: Initial Login

Initial login with:

User Name: admin Password: admin

cacti: Change Password

Use the same *inst* password to keep things simple for our workshop.

nsrc@intERLab

cacti: Finishing

As you can see the idea is to do the following:

- Define the devices you wish to monitor
 Define the graphs you wish to use for each device
 View and organize graphs as you want

Note that cacti takes advantage of snmp settings. As possible we'll set up some cacti graphs at this time.
