

Network Monitoring & Management

A few Linux basics

Our chosen platform

Ubuntu Linux

- LTS = Long Term Support
- no GUI, we administer using ssh
- Ubuntu is Debian underneath
- There are other platforms you could use:
 - CentOS / RedHat, FreeBSD, ...
- This isn't a UNIX admin course, but some knowledge is necessary:
 - Worksheets are mostly step-by-step
 - Please help each other or ask us for help

You need to be able to....

- Be *root* when necessary: `sudo <cmd>`

- Install packages

```
$ sudo apt-get install <pkg>
```

- Edit files

```
$ sudo nano /etc/mailname
```

```
$ sudo vi /etc/mailname
```

- Check for the process “apache”

```
$ ps auxwww | grep apache
```

- Start/Stop/Status of services

```
$ systemctl [start|stop|status] <NAME>
```

nano editor

- Ctrl-x y “n” quit without saving
- Ctrl-x y “y” to quit and save
- Ctrl-g for help
- Ctrl-w for searching
- Cursors work as you expect

vi editor

- The default editor for all UNIX and Linux distributions
- Can be difficult to use
- If you know it and prefer to use vi please do
- We provide a PDF reference in the materials

Other tools

- Terminate foreground program:
 - `ctrl-c`
- Browse the filesystem:
 - `cd /etc`
 - `ls`
 - `ls -l`
- Delete and rename files
 - `mv file file.bak`
 - `rm file.bak`

Viewing files

Sometimes files are viewed through a pager program (“more”, “less”, “cat”). Example:

- `man sudo`
- Space bar for next page
- “b” to go backwards
- “/” and a pattern (/text) to search
- “n” to find next match
- “N” to find previous match
- “q” to quit

Using ssh

Configuring and using ssh incorrectly will guarantee a security compromise...

The wrong way:

- Using simple passwords for users
- Allowing root to login with a password
- In reality – allowing *any* login with a password

The right way:

- Disable all password access
- Disable root access with password
- Some disable root access completely

Using ssh: our way

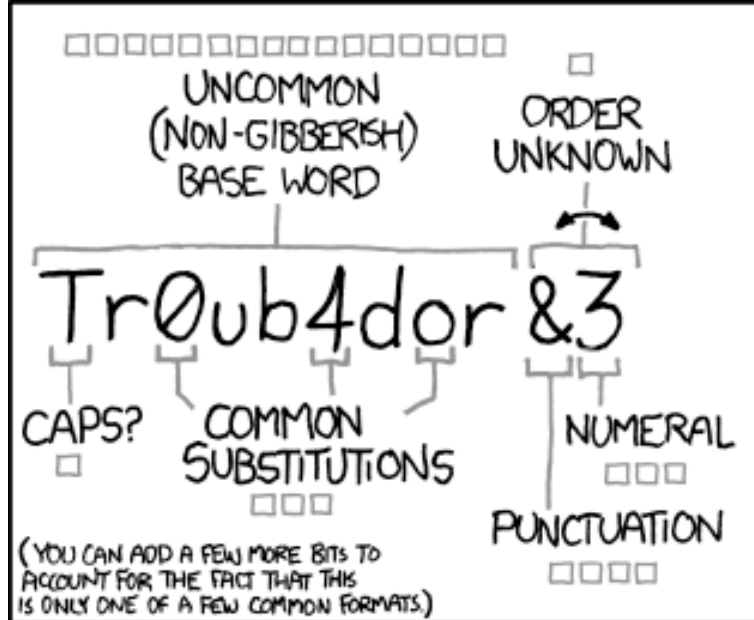

For class we will compromise.

Our way:

- Allow user login with improved passwords
- Allow root login with ssh keys only

Understanding password strength, see next slide...*

*<https://xkcd.com/936/>

~28 BITS OF ENTROPY

□□□□□□□□
□□□□□□□□
□□□
□□□□

$2^{28} = 3 \text{ DAYS AT}$
1000 GUESSES/SEC

(PLAUSIBLE ATTACK ON A WEAK REMOTE
WEB SERVICE. YES, CRACKING A STOLEN
HASH IS FASTER, BUT IT'S NOT WHAT THE
AVERAGE USER SHOULD WORRY ABOUT.)

DIFFICULTY TO GUESS:
EASY

WAS IT TROMBONE? NO,
TROUBADOR. AND ONE OF
THE 0s WAS A ZERO?

AND THERE WAS
SOME SYMBOL...

DIFFICULTY TO REMEMBER:
HARD

~44 BITS OF ENTROPY

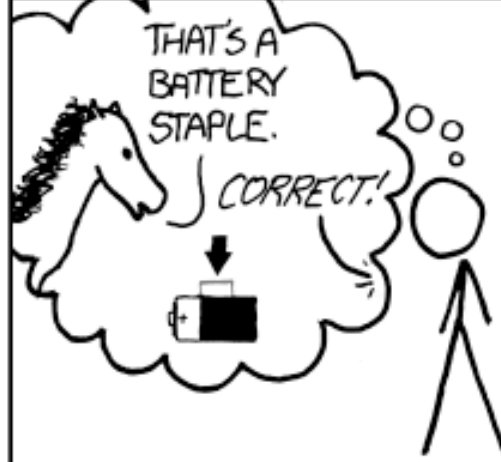

□□□□□□□□□□
□□□□□□□□□□
□□□□□□□□□□
□□□□□□□□□□

$2^{44} = 550 \text{ YEARS AT}$
1000 GUESSES/SEC

DIFFICULTY TO GUESS:
HARD

THAT'S A
BATTERY
STAPLE.

CORRECT!

DIFFICULTY TO REMEMBER:
YOU'VE ALREADY
MEMORIZED IT

THROUGH 20 YEARS OF EFFORT, WE'VE SUCCESSFULLY TRAINED
EVERYONE TO USE PASSWORDS THAT ARE HARD FOR HUMANS
TO REMEMBER, BUT EASY FOR COMPUTERS TO GUESS.

No passwords are better

Improve password for *sysadm*

Method 1 (moderately strong)

- 8 characters or more
- Not a word in any language
- A mix of numbers, upper and lower case
- Include some punctuation characters

Method 2 (stronger)

- Use four words of 6 characters, or more
- Use unrelated words

Examples (*do not use these!*)

1. Tr0ub4dor&3
2. CorrectHorseBatteryStaple

Using ssh to connect to your VM

Login to your virtual machine using ssh

- On Windows use `putty.exe`
- Connect to pcN as user `sysadm`
- ***We'll do that now...***

- Accept Public Key when prompted
- Windows users can download *putty* from <http://www.ws.nsrc.org> and connect
- Instructors will now assist everyone to connect

Change sysadm password

Logged in as user *sysadm* do:

```
$ passwd
changing password for sysadm.
(Current) UNIX password:    <enter current password>
Enter new UNIX password:    <enter new password>
Retype new UNIX password:    <confirm new password>
```

If everything goes well you will see the message:

```
passwd: password updated successfully
```

Disable *root* user password access

Logged in as user *sysadm* do:

```
$ sudo editor /etc/ssh/sshd_config
```

Find the lines that say:

```
#PermitRootLogin no  
PermitRootLogin prohibit-password
```

No changes are needed, please leave these lines as they are and be sure you

```
PermitRootLogin yes
```

Now exit the file.

Finish initial VM configuration

Now we'll do our initial VM configuration, including:

- Software package database update
- nano editor software installation
- Install network time protocol service and update time
- Install mail server and utilities
- Practice using logs
- Practice using man
